RESEARCH INTERESTS

Quantum computing for optimization and machine learning on near-term (NISQ) devices — QUBO and Ising formulations, quantum annealing, QAOA and variational quantum algorithms, and quantum machine learning — applied to the modelling, forecasting and operation of energy systems, including their deployment for real-time inference on edge hardware. Secondary interests in deep learning for multivariate industrial time series and in techno-economic assessment of hydrogen technologies.

CURRENT PROJECT

Mapping Green Hydrogen Infrastructure Planning onto NISQ Devices: A QAOA Study of Electrolyser Siting

Poster · School on Quantum Simulation in the NISQ era · ICTP-SAIFR / IFT-UNESP, São Paulo · Nov 2026

Where should electrolyser plants go in Brazil's Northeast? The siting problem is built entirely from open Brazilian data (ONS curtailment, OpenStreetMap substations, road distances, electricity prices), encoded as a 16-qubit QUBO and solved with QAOA in simulation and on IBM quantum hardware. The study maps which structural feature binds first: QAOA learns the constraints, but the cost differences between good plans are too small, inside the penalty-dominated energy scale, for the circuit to prefer the best one.

16 qubits
4 candidate sites × 3 demand hubs

~140×
valid plans found above chance (simulation)

21× / 20× / 9×
on IBM Heron (ibm_kingston), 1–3 layers

EDUCATION

Master of Science in Applied Physics

UNILA · 2025 – present · expected defense Mar–Apr 2027

- Dissertation (provisional): *Edge AI and Quantum Machine Learning for Real-Time Monitoring of Green Hydrogen Systems*. Advisor: Prof. Dr. Raphael Fortes Infante Gomes.
- Research focus: quantum machine learning applied to energy systems, with real-time inference on embedded hardware (Raspberry Pi).
- Full merit-based graduate fellowship from CAPES (Brazilian Ministry of Education), awarded through competitive national selection.

Bachelor of Science in Engineering Physics

UNILA · 2019 – 2025

- Thesis: development of a pilot algorithm for predicting the hydrogen outlet temperature in the production plant at Itaipu Parquetec — a hybrid quantum–classical study benchmarking a quantum LSTM (QLSTM) against classical recurrent architectures on operational data from an alkaline electrolyzer. Advisor: Prof. Dr. Raphael Fortes Infante Gomes.

RESEARCH EXPERIENCE

Machine Learning Research Fellow

Itaipu Parquetec — Center for Hydrogen Technologies · 2024 – present

- Deep-learning models for predictive maintenance and operational forecasting of an alkaline water electrolyzer (LSTM and recurrent architectures in PyTorch, multivariate plant telemetry).
- Extended the forecasting pipeline to hybrid quantum–classical models, benchmarking quantum LSTM architectures against classical counterparts on the same dataset.
- Deep reinforcement learning for automated feature selection, with Optuna-based hyperparameter search, to forecast temperature, pressure and stack voltage.
- Designed and deployed a real-time predictive operations dashboard used by plant staff for decision support.
- Co-developed the techno-economic assessment of a prototype hydrogen-powered boat and contributed to its assembly; supported assembly and integration of a hydrogen power generator, with technical and economic viability models.

Undergraduate Researcher — Self-Powered Systems

UNILA · 2021 – 2022

- Self-powered acquisition system for autonomous sensors; programmed pyranometers and pyrheliometers for solar-irradiance data acquisition and processing.

Undergraduate Researcher — Astronautics

UNILA · 2020 – 2021

- Aerodynamic modelling of rocket components (nose cone and fins) in Autodesk Inventor, followed by physical prototyping.

TEACHING & OUTREACH

Outreach Instructor — Smart Solar Collector

UNILA · 2023 – 2024

- Designed and taught hands-on classes using Arduino and relay circuits, covering foundational physics and the operation of low-cost smart solar collectors.

Outreach Project Member — Educational Materials

UNILA · 2022 – 2023

- Designed layouts and specified material properties for educational cards teaching the physical concepts of metallic materials.

AWARDS & LEADERSHIP

CAPES Graduate Fellowship

Brazilian Ministry of Education · 2025 – present

Honorable Mention — V SIEPE

Week of Teaching, Research and Extension · Foz do Iguaçu · 2023

Vice President — Academic Center of Engineering Physics (CAEF)

Apr 2024 – Apr 2025

SKILLS & COURSEWORK

Technical skills

- **Quantum computing:** Qiskit, PennyLane, D-Wave Ocean; QUBO/Ising formulations, quantum annealing, QAOA, variational circuits, QML (QLSTM, QSVM)
- **Deep learning:** PyTorch, TensorFlow, LSTM and recurrent architectures, deep reinforcement learning, Optuna
- **Data & tooling:** Python, LaTeX, scikit-learn, pandas, NumPy, Git
- **Engineering:** predictive maintenance, techno-economic assessment, hydrogen and electrolysis systems, microcontrollers, Arduino, Autodesk Inventor

Graduate coursework

- Quantum Computing I & II (2025–2026)
- Quantum Mechanics
- Artificial Intelligence Applied to Scientific Research

Languages

- Portuguese — native
- English — C1
- Spanish — C1
- Mandarin — A1
